Outline

- Objective Components of Visualizing Data
- Tools and Data Types
- Case Studies

Case I: Growth of the Nova Scotia
Blanding's Turtle

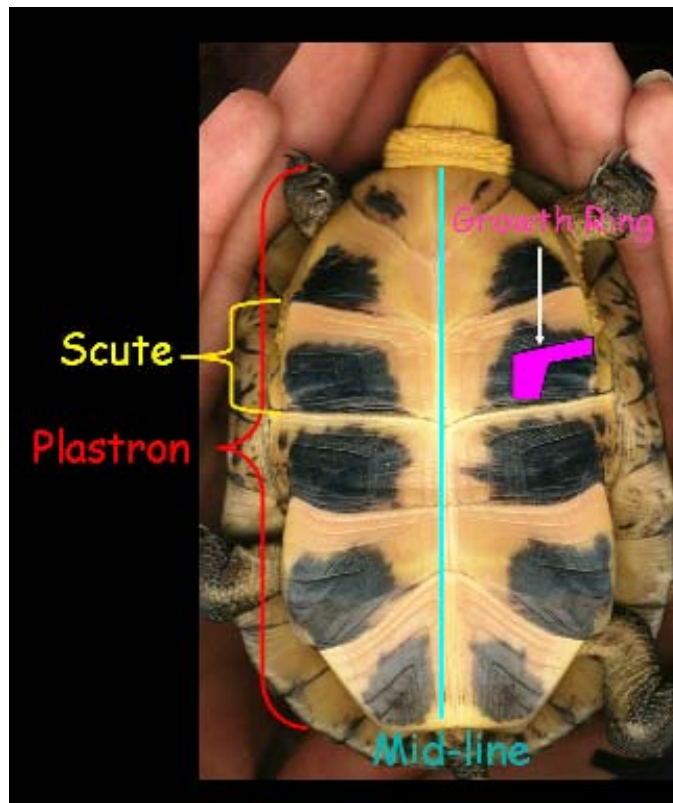

Case II: Health Utility Index

Objective Components

- Data exploration
- Fitting
- Model diagnostics

Case I: Growth of the Blanding's Turtle

(Huang, Zhang, Cabilio, M. Richard, and Herman, 2009)

- They mature at age 20-25 (growth stops)
- 123 Blanding's turtles from 3 different locations in NS
 - 73 from Kejimikujik (KNP)
 - 18 from McGowan Lake (ML)
 - 42 from Pleasant River (PR)

Case I: Data
Exploration

Growth Ring

Growth Ring by Scute

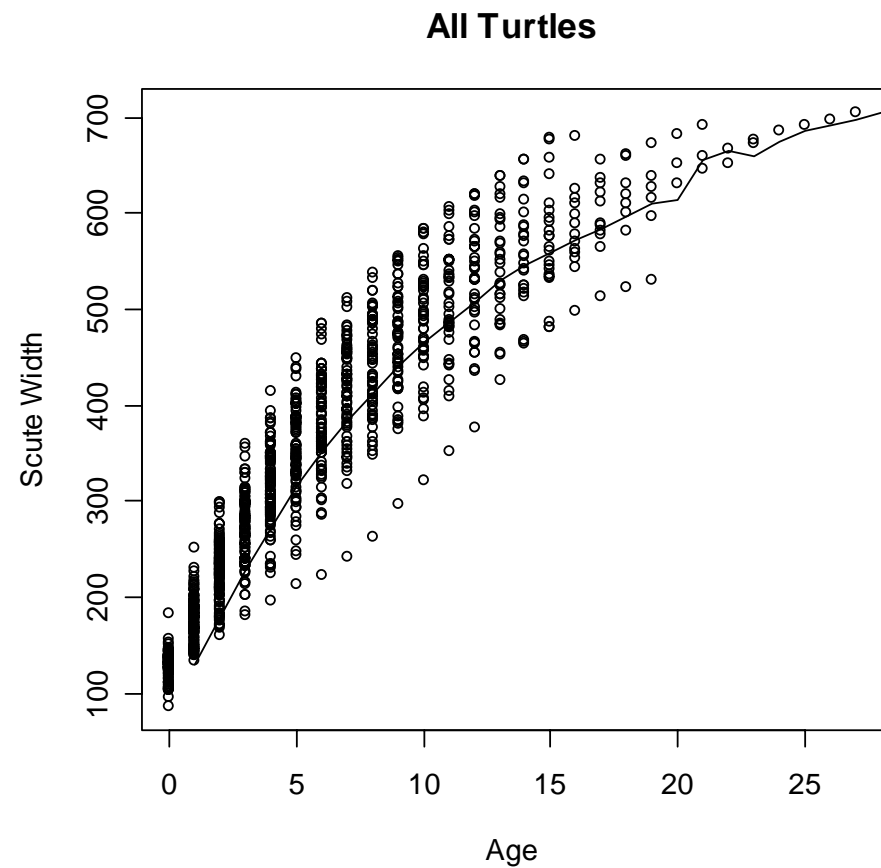

Case I: Fitting

Accumulated Growth Curve

Accumulated Growth:
Scute Width

$$SW_n = \sum_{i=1}^n R_i$$

Case I: Fitting

Exponential Growth

$$SW_t = a (1 - be^{rt})$$

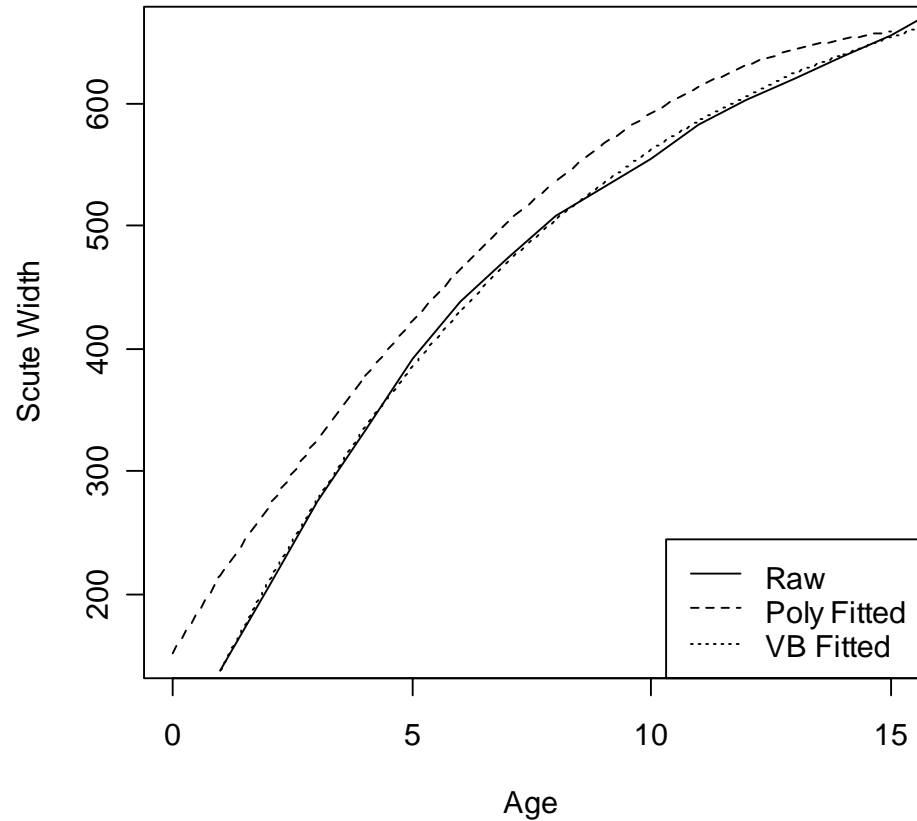

a is asymptotic length;

b is a variable related to size at birth;

e is the base of the natural logarithms;

r is an intrinsic growth factor

Turtle 9-1, 8 KNP

Case II: Health Utilities Index (HUI) (Bu, 2006)

- To measure health-related quality-of-life/ functional-status in clinical trials
- To describe and monitor the health of general populations
- <http://healthutilities.biz/> lists lots of papers of the validation of HUI.

Case II: Health Utilities Index (HUI)

Attributes (7):

Sensation (4 levels)

Mobility (5 levels)

Emotion (5 levels)

Cognition (4 levels)

Self-Care (4 levels)

Pain (5 levels)

Fertility (3 levels)

*Note: HUI2 describes 24,000 unique health states.

Attributes (8):

Vision (6 levels)

Hearing (6 levels)

Speech (5 levels)

Ambulation (6 levels)

Dexterity (6 levels)

Emotion (5 levels)

Cognition (6 levels)

Pain (5 levels)

*Note: HUI3 describes 972,000 unique health states.

Case II: Health Utilities Index (HUI)

HUI is applicable to most people. It provides descriptive health profile measures and HRQL scores on a generic scale. HUI also provides single-attribute scores of morbidity for each attribute.

Each HUI attribute (dimension) has 3-6 levels of discrimination and is very responsive to changes in health caused by treatment therapies or other influences.

Case II: Model diagnostics

Data resource: National Population Health Survey (NPHS) 1996 & Canadian Community Health Survey (CCHS) 2000

Tools and Data Types

(Cleveland, 1993)

- Univariate Data
- Bivariate Data
- Multi-way Data

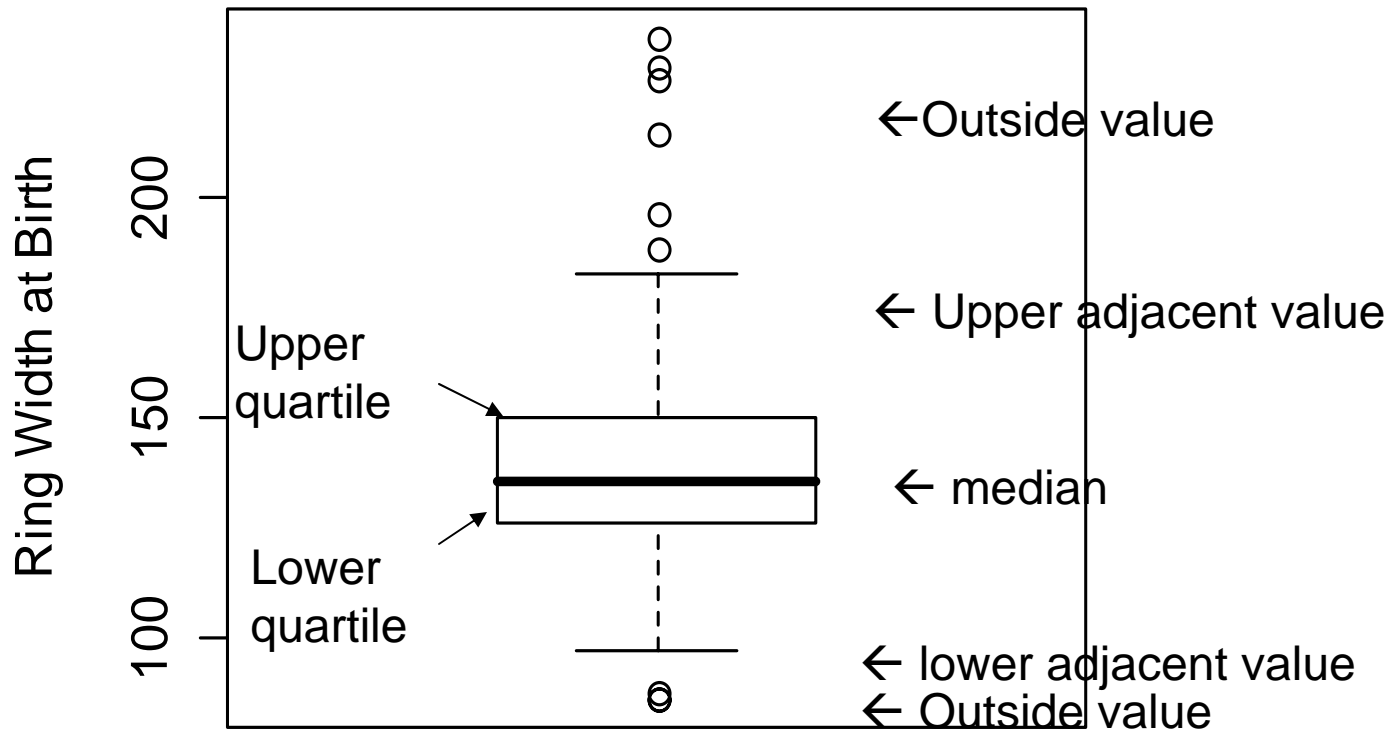

Learning the Distribution of the Univariate Data

Box Plot

- A graphical display of the quartiles and the extreme values of a sample.
 - To catch features of a sample: *Location, Spread, Skewness, Outliers*
 - Very useful for comparing several data sets with respect to these characteristics

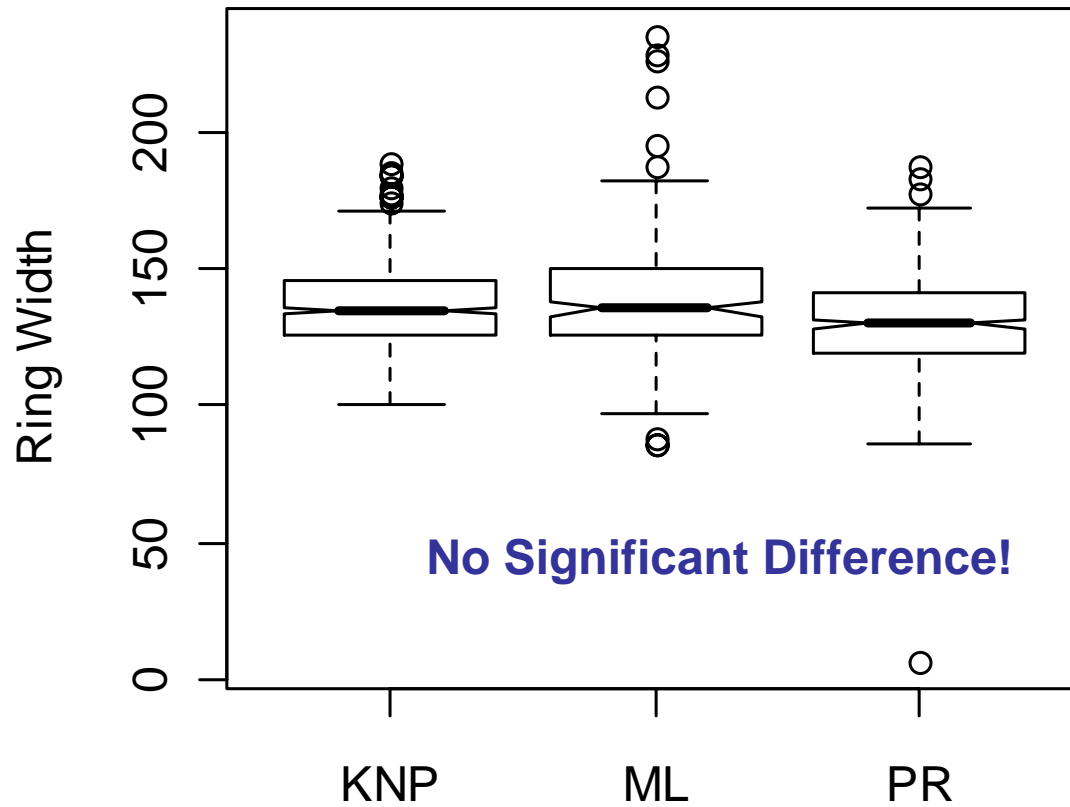

Box plot

McGowan Lake

Box Plot

Ring Width Growth at Birth

Box Plots

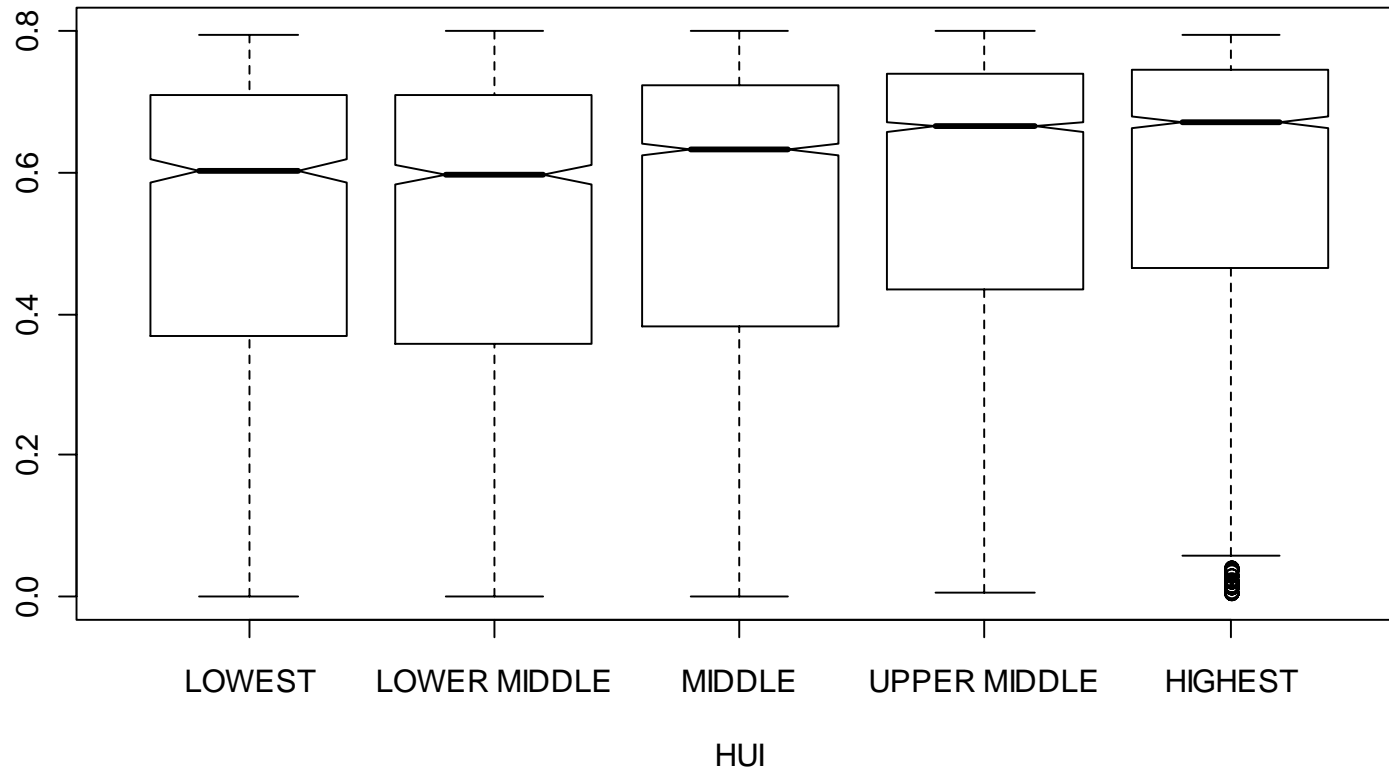

Ring Width Growth of One Year's Old

Box Plot

•The richer, the healthier?

HUI and Income Levels

Histogram

- Relative frequency histogram
 - A picture of the relative frequency of that sample
- Density histogram
 - The relative frequency of a class is equal to the area of the rectangle above that class.
- Very useful for learning distribution shape

Some Typical Sample Shapes

Right Skewed

Left Skewed

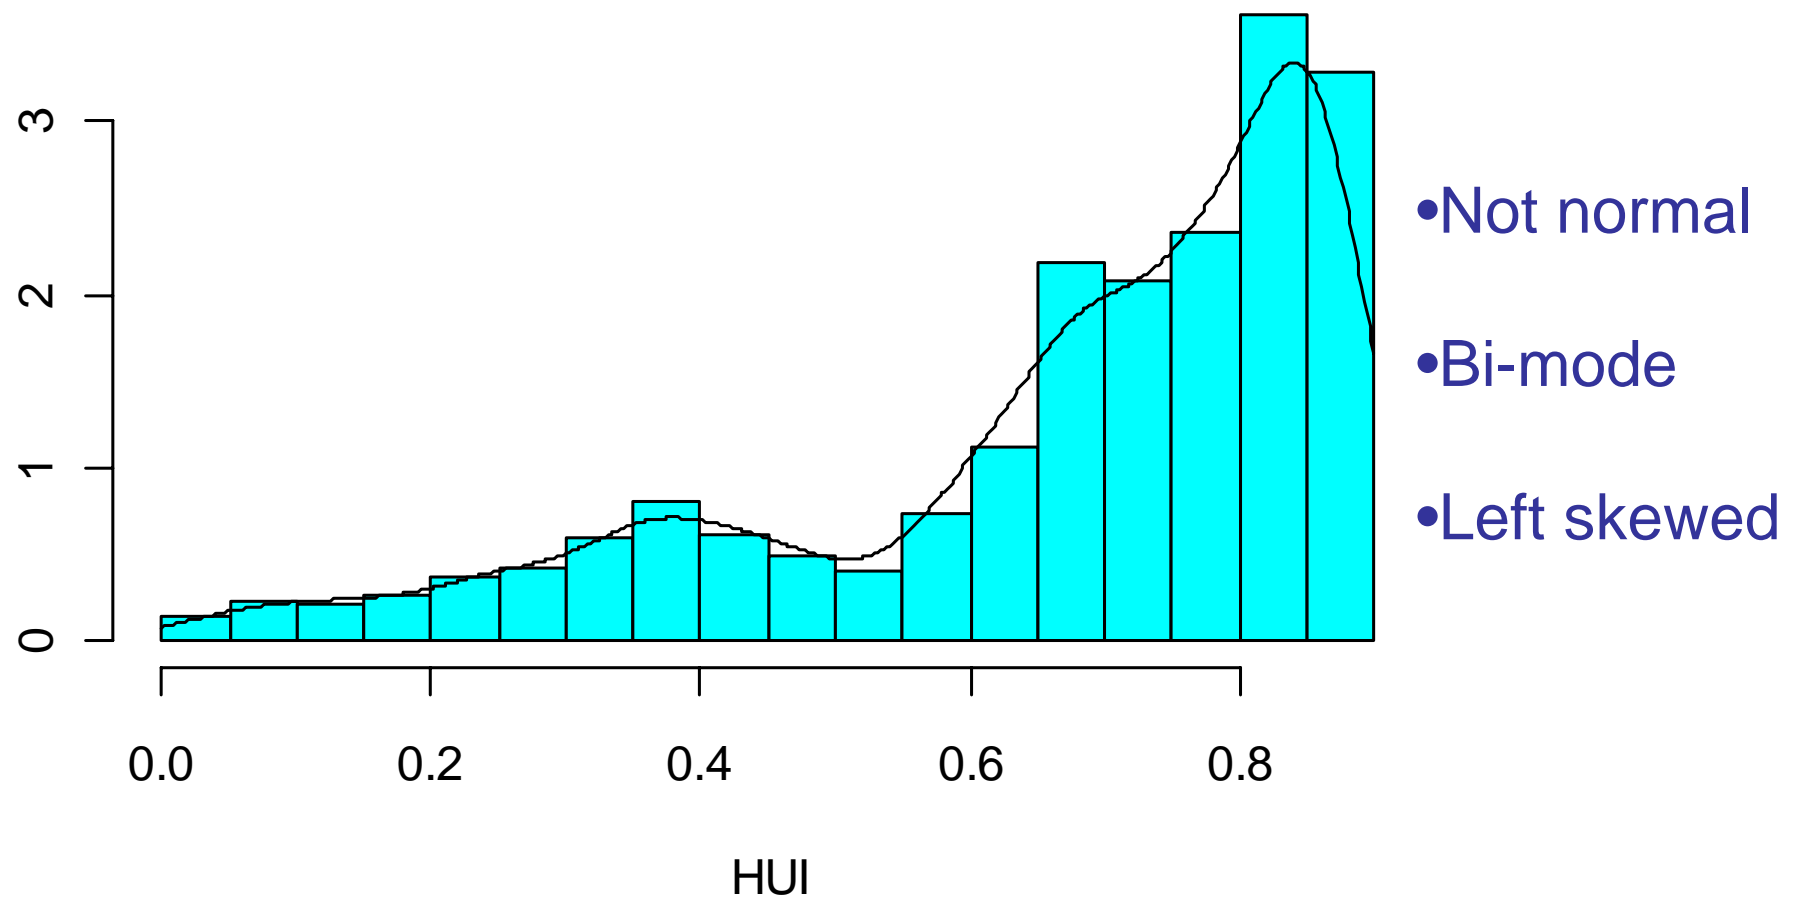

Bell Shaped

--- From Math 2233, Statistics for Life Sciences 1, Course Notes (Cabilio and Masaro)

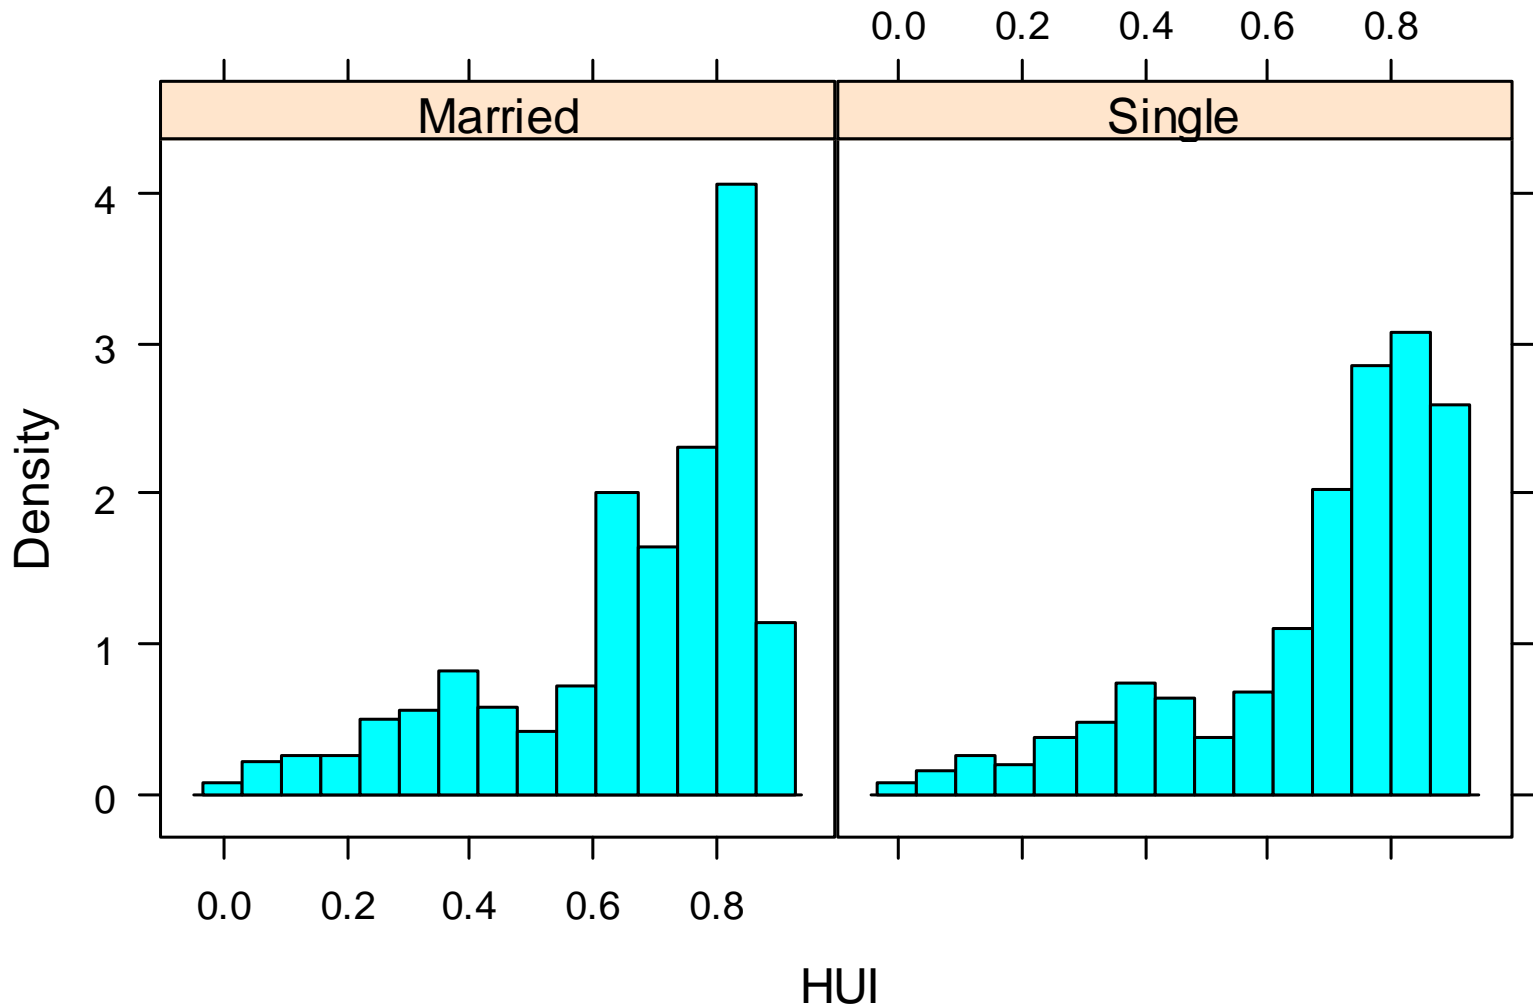

Histogram and Density Plot

Female

Histogram and Density Plot

Female

Probability Plot

- The normal distribution scores vs the sort sample
- Prototype probability plots

Normal	Left Skewed	Right Skewed	Light Tailed	Heavy Tailed
				

--- From MATH 2243, Statistics for Life Sciences 2, Course Notes (Cabilio and Masaro)

Histogram and Probability Plot

Ring Width at Birth

Normal Q-Q Plot

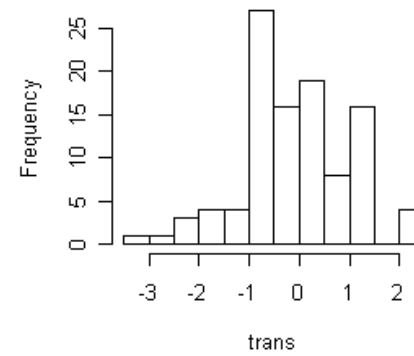

Histogram and Data Transformation

Histogram of HUI.0

Histogram of trans

Histogram of HUI1.0

Histogram of trans1

Learning the Relationship from the Bivariate Data

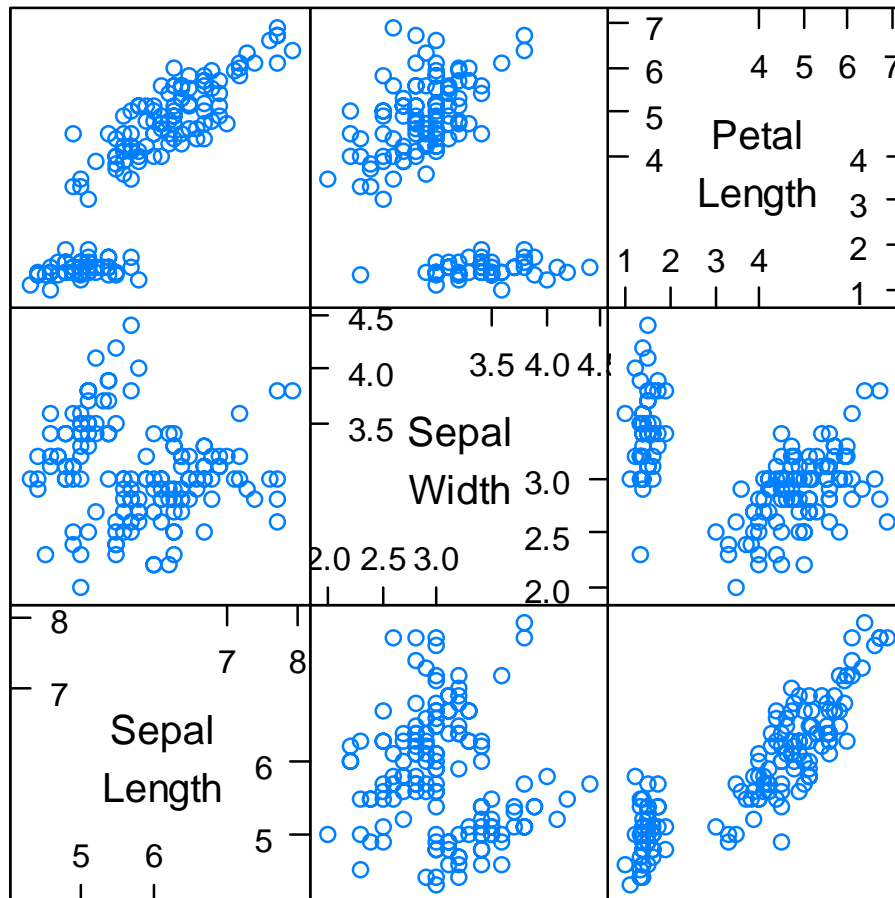

Scatter Plot Smoothing

Distance vs Speed

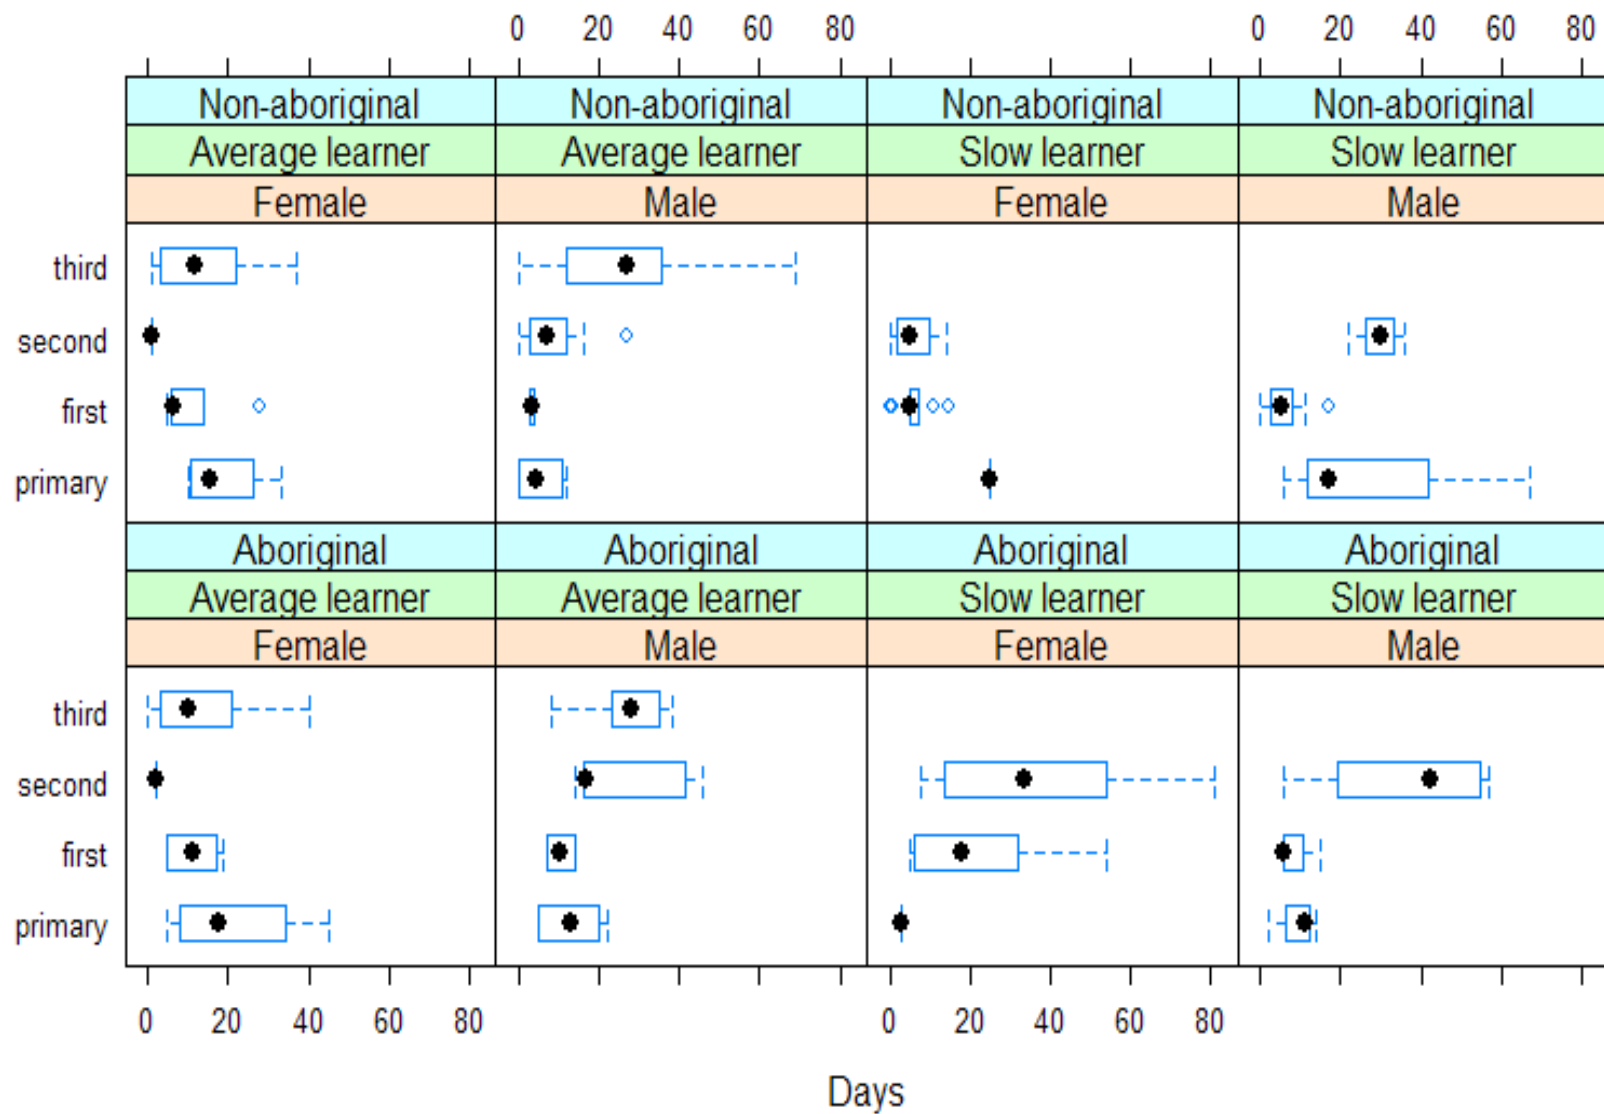

Scatterplot Matrix

Virginica Iris

Scatter Plot Matrix

Learning the Interaction Effect from the Mutiway Data
